

System Deployment Guide App Movil

In the production enviroment

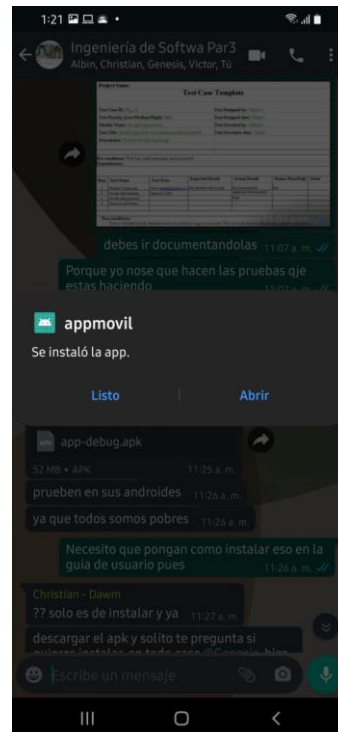

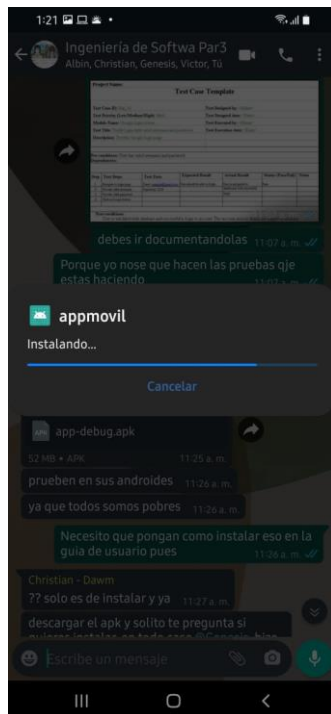

- 1- Go to the GitHub: <https://github.com/scarletespinozaMoreno/Rrecursos-Documentacion-Proyecto-Ing2-ServiceSoft> into the folder and donwaload the .apk in your cellphone.

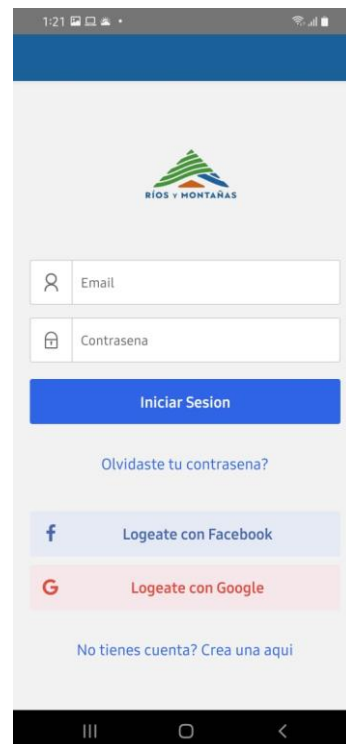

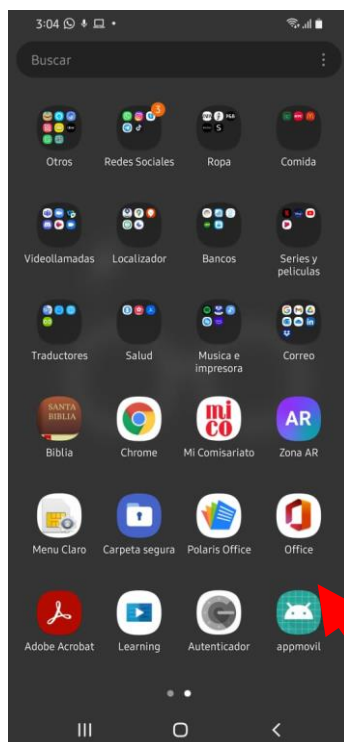

- 2- Once the apk is on your cell phone, you must allow its installation.

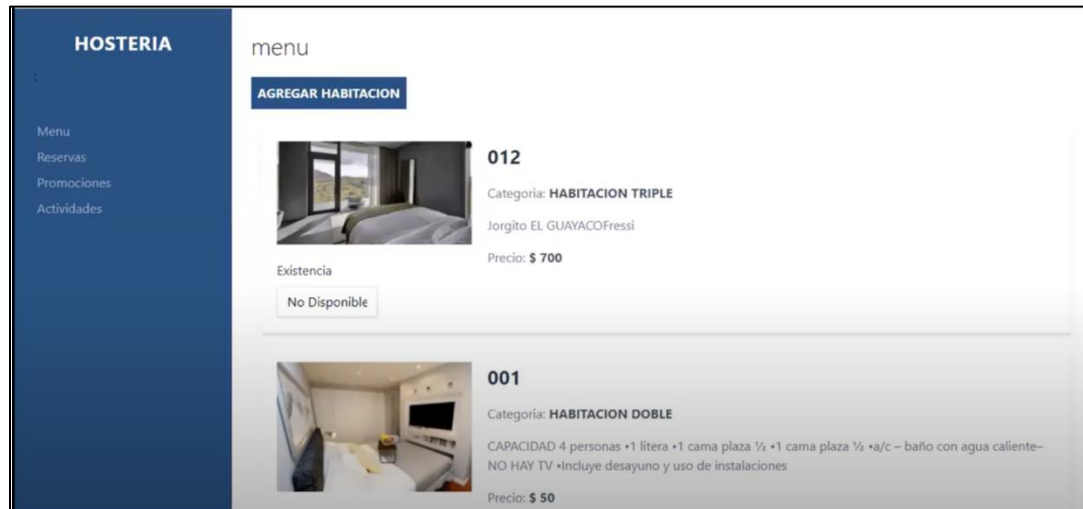

3- Wait for it to install.

4- Finally the application is in your device and you can use it.

As end user

1.- In this image we can see the section of the administrator's panel, in which we have the section of rooms, reservations, promotions and activities.

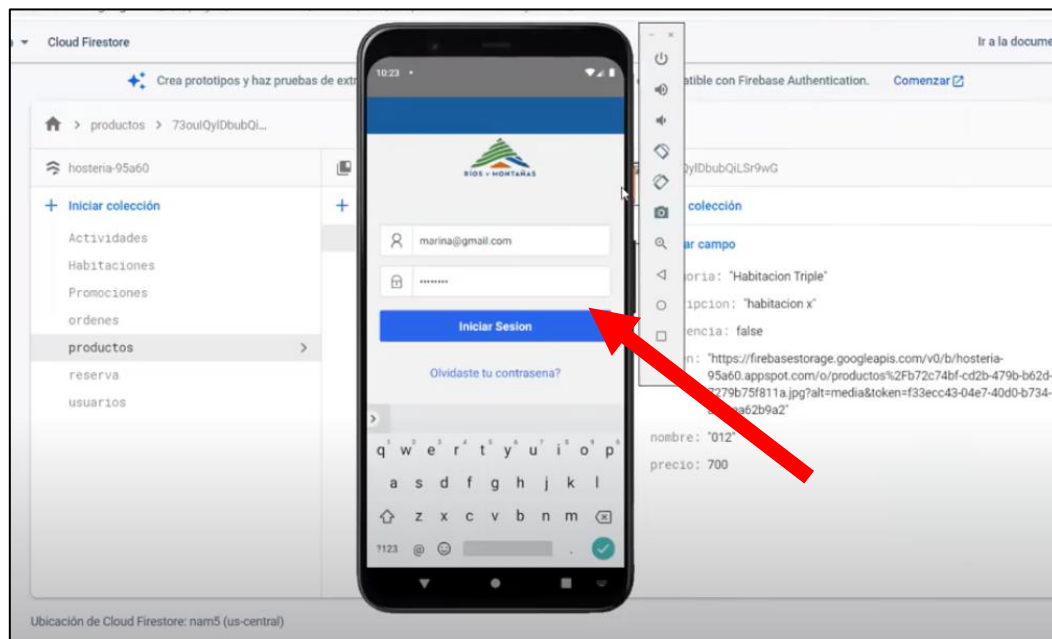

2.- Here we can see what are the requirements of the room that the administrator must enter into the panel so that the user can view the list of rooms, each data that he enters about the room has different validations, the added rooms will be stored in firebase.

The screenshot shows the 'HOSTERIA' administrator panel. On the left is a dark blue sidebar with a menu containing 'Menu', 'Reservas', 'Promociones', and 'Actividades'. The main area is a light gray form titled 'HOSTERIA' with the following fields:

- Nombre:** A text input field with the placeholder 'Nombre habitacion'.
- Precio:** A text input field with the placeholder 'Nombre \$20'.
- Imagen/:** A file upload section with a 'Choose File' button and the text 'No file chosen'.
- Categoria:** A dropdown menu with the placeholder '-- Seleccione --'.
- Descripción:** A large text area with the placeholder 'Descripcion de habitacion'. A red arrow points to this field.

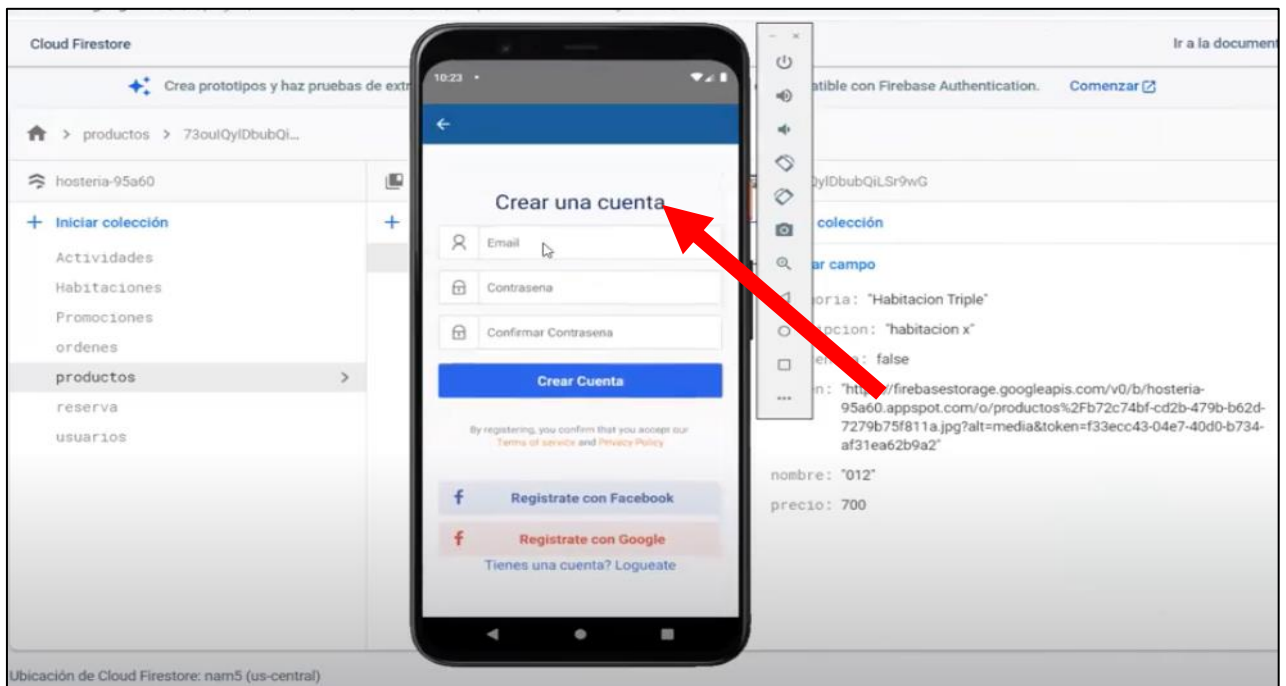

3.- Everything that we can save in the administrator panel can be seen in both the web and mobile applications.

-In the mobile application, the first thing we must do is enter the application with our user.

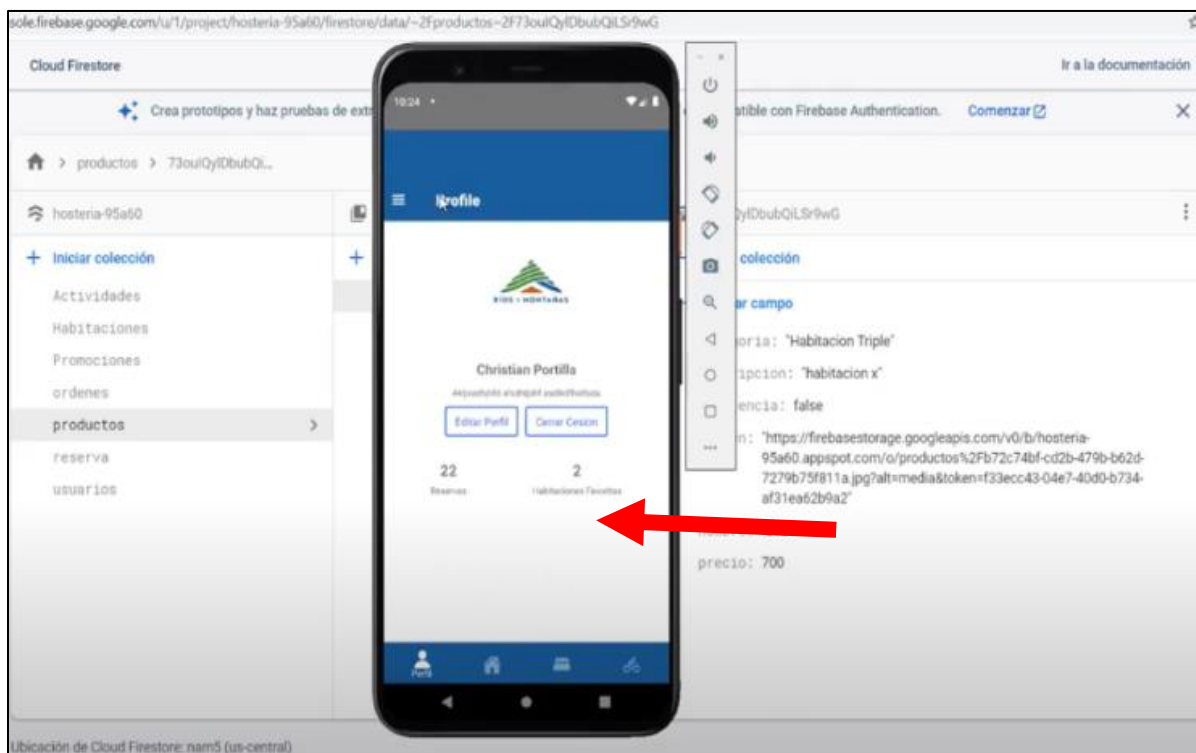

4.- In case the user does not have a registered account, he can create one.

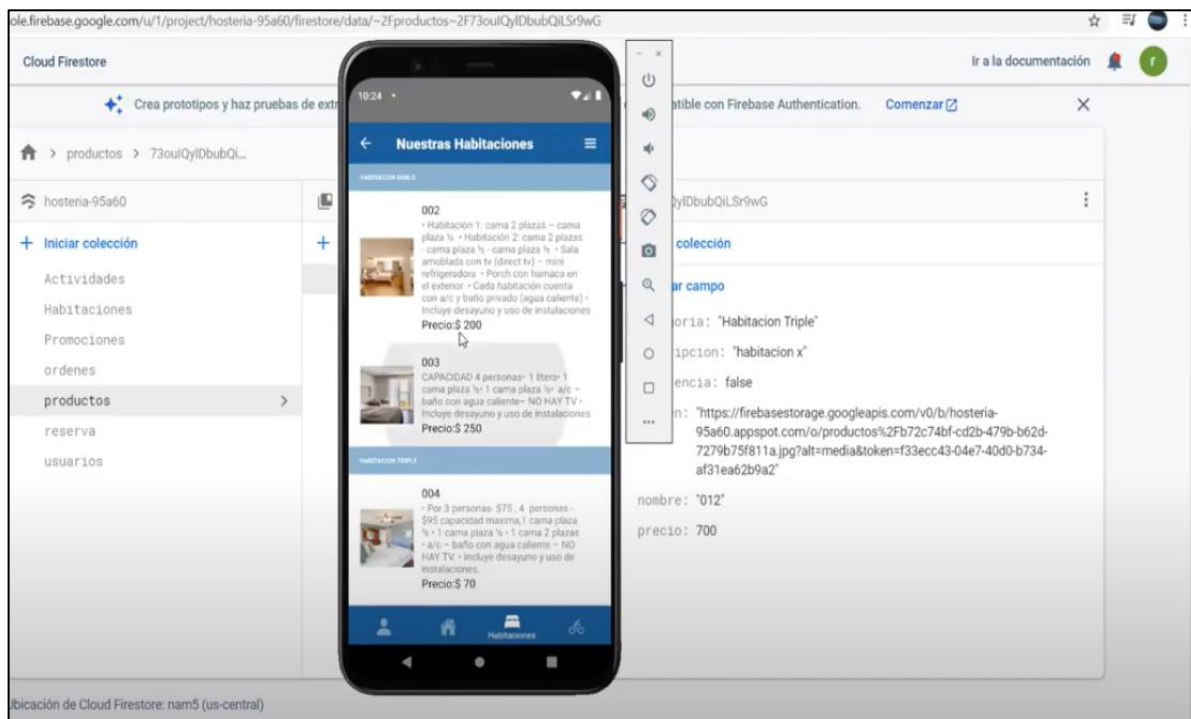

-As can be seen in the image, you must fill in the following fields that are mandatory and that are also validated, automatically these data will be saved in firebase.

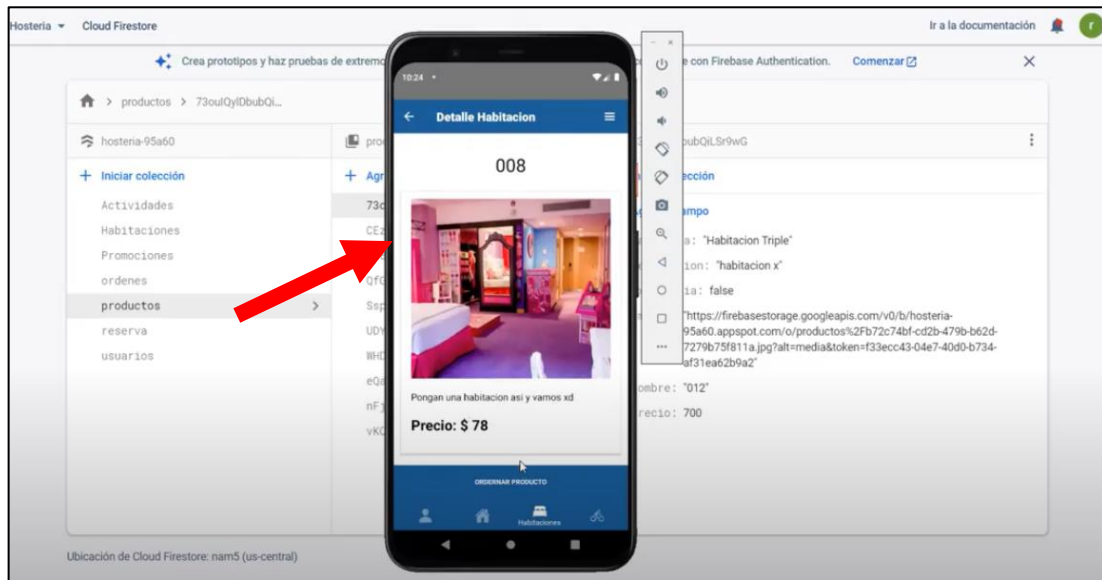

5.- As we can see in the image, the user also has the option to edit their personal data.

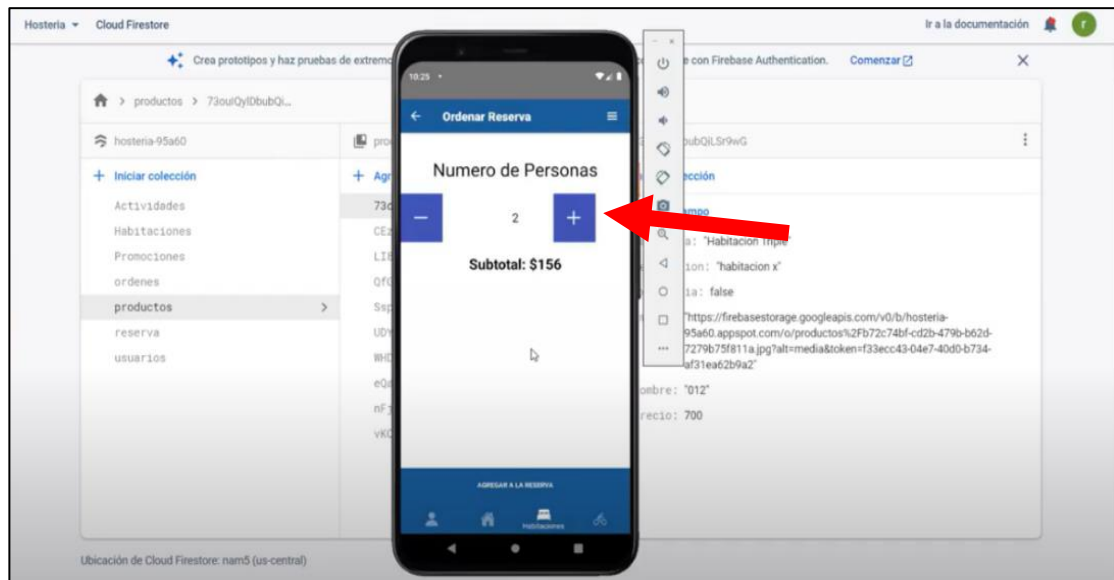

6.- Once the user enters his session, he will be able to review the different rooms that have been entered by the administrator

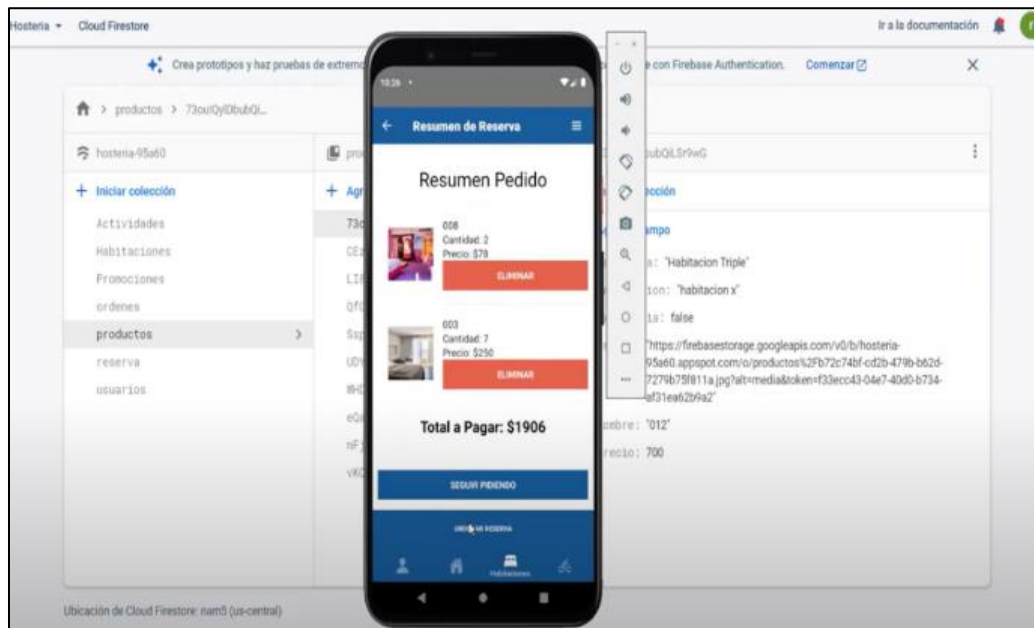

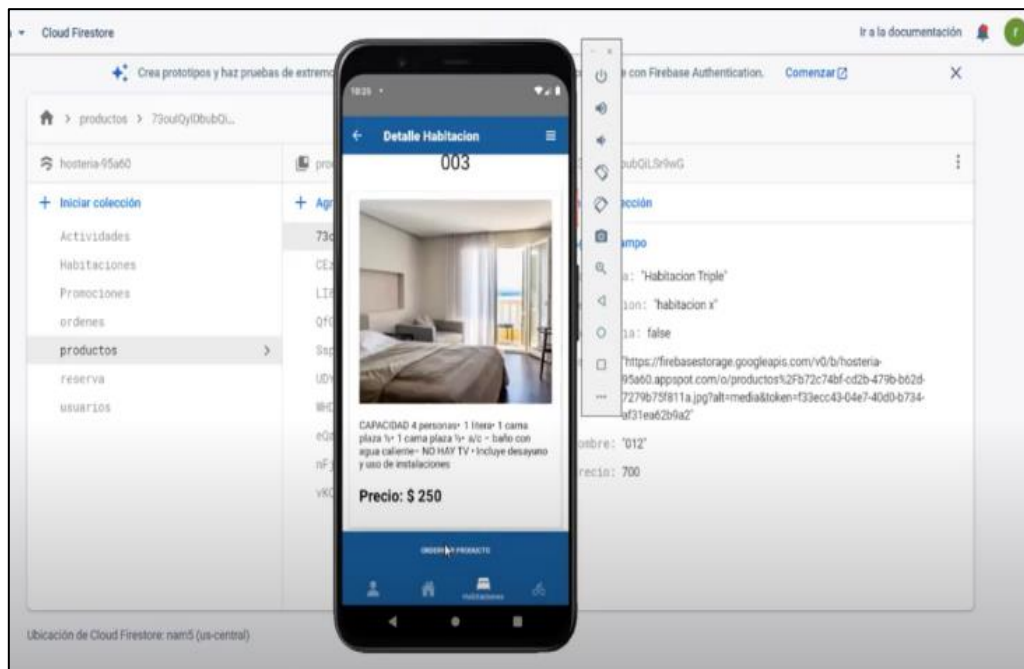

7.- Once the user can see the rooms, they can also select the room they want to make the reservation.

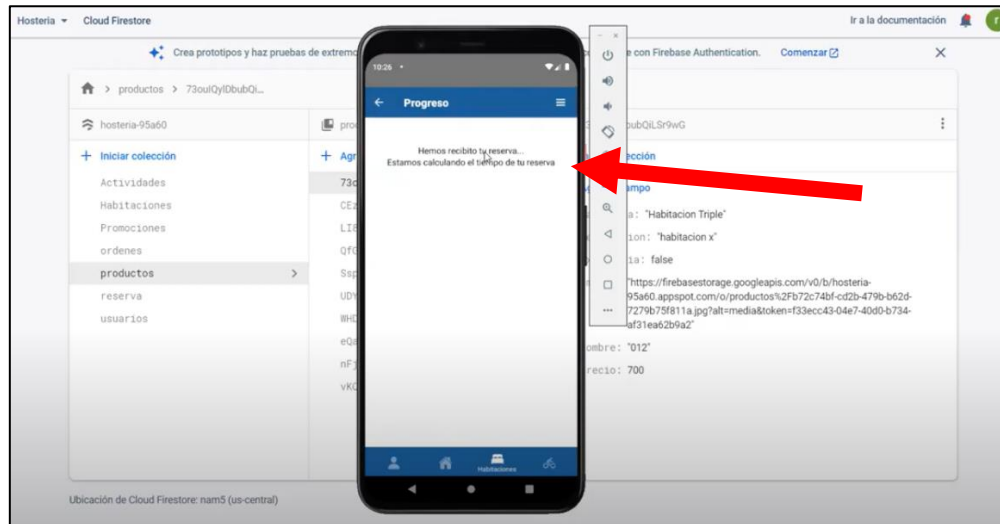

8.- Once we choose the room for the reservation, we will also choose the number of people who will stay in that room.

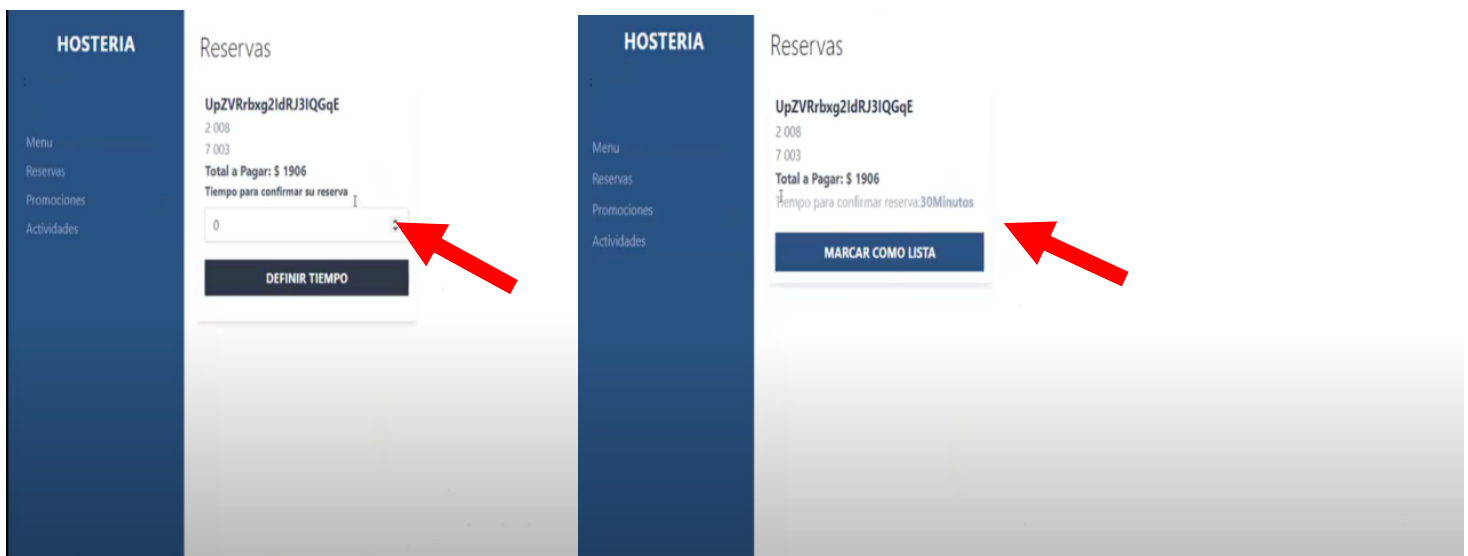

9.- After this we could see the detail of the reservation, in this way we can see if there is any wrong detail to be able to correct it.

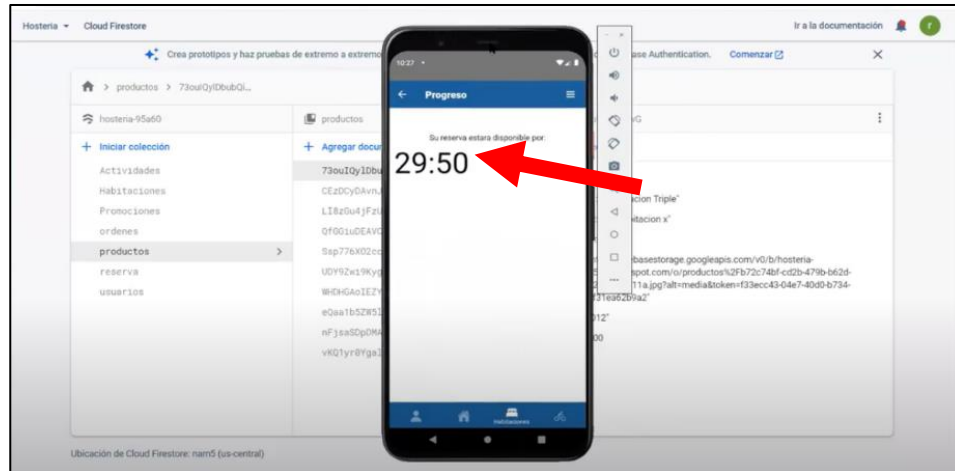

10.- After this, a message will come out in which the user will be notified that the reservation must be accepted by the administrator.

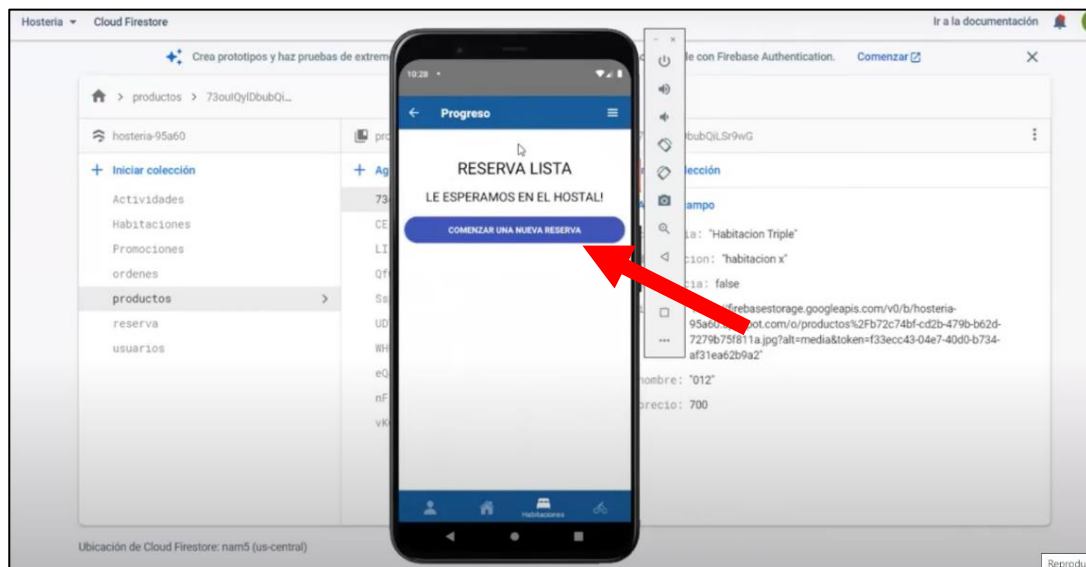

11.- After this, the administrator will appear on his panel the reservation made by the user, the administrator will proceed to set a time limit for the user to cancel the reservation, once that time ends the reservation will be marked as list.

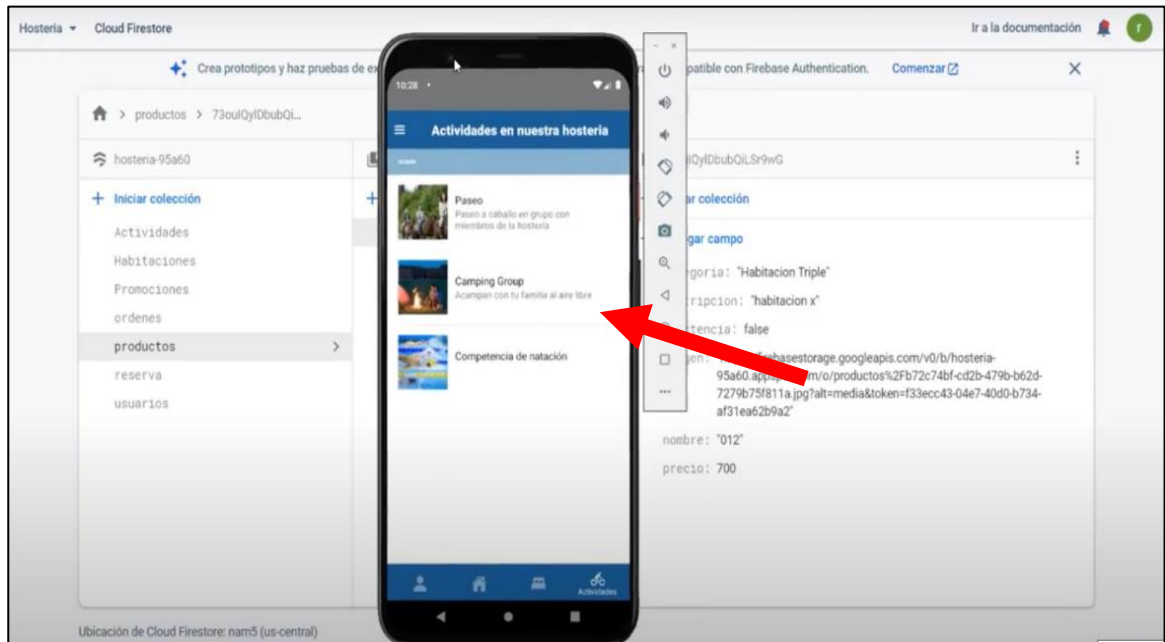

12.- As we can see in the image, after that a message will appear that the reservation is ready and that it will be expected at the hotel.

13.- In the same way that the administrator can add the rooms, he can also add the activities so that the user can reserve the activity.

14.- And finally, the same process for the promotions, he can also add the promotion so that the user can reserve the promotion.
